

Add Transformation

Source Column *

FirstName x

Select multiple columns for transformations that combine data (e.g., concatenation)

Target Column Name(s) *

FirstName_Upper

For multiple output columns (like str_split), separate column names with commas

☐ Keep original column (creates new mapping if target column name is different)

Transformation Rules

+ Add Rule

Rule 1

Rule Type *

str_upper

Convert string to uppercase Parameters - keep_original: either True or False. Based on this value original column will be retained.

Execution Order

0
